SDC HACKATHON 2026

RunPod - Not Used

Team Empathy Coders | OrderPilot | SDC Hackathon 2026 - Domain 2

Declaration

OrderPilot does not use RunPod. The project has no GPU workload: no model training, no fine-tuning and no GPU inference. The AI model is a hosted API (DeepSeek chat/completions). The US$25 RunPod credit was not used. No Pod, serverless endpoint, GPU type or usage record exists for this project.

Why this document exists

The official submission asks for RunPod proof only when the project uses GPU compute. OrderPilot is a CPU-only Node.js/Express web application. Removing RunPod from the architecture keeps the demo cheap, reproducible and easy to deploy on Replit. This one-page declaration makes the 'not used' status explicit so the judges do not have to infer it from an empty section.

What the project uses instead

- Replit Core credit for development, runtime, Secrets and deployment.
- DeepSeek's hosted chat/completions API for text classification and field extraction.
- A deterministic rules extractor as the fallback when the AI API is unavailable.
- No GPU, no model weights, no training data and no RunPod endpoint.
